What is the problem the group try to address?

Currently there are no disaster management android applications that gives the user a list of inventory to collect in the event of an imminent disaster.

The proposed solution

Our aim is an application that informs the user of the items they need to collect for a given disaster, where they can collect them from and the best number to call. It will be built as a simple android app that periodically collects the best information from the internet.

Potential competitors

<https://play.google.com/store/apps/details?id=md.apps.Blizzard&hl=en> tells you what resources to get for winter, but obviously doesn't include other natural disasters. The app is also very old.

Issues

The app is very niech, and could only really be used once in a very long time. The app will require internet to download the latest information which the user may not have at the time.
