Valet app

The valet app would work by a user requesting that their car is picked up from anywhere and parked in the nearest car park. Would be used in cities where finding parking is complicated and takes away the anxiety of finding parking space.

Inventory app

Used to keep track of food in a house. Every user has the food synced, when they use something they mark using it and everyone gets the update. Anyone can make a shopping list from the missing food and add food when they buy it

Both of these ideas, are not viable as they do not fit under the categories.

Disaster inventory app

Tells the user what they need to pick up for a certain disaster, tells the user where they need to get that stuff from.Downloads the information about things you need from a database on the internet (JSON file). Also includes details on how to survive said thing/instructions on what to do next.

How it works:
(Type in the disaster name and the app displays the contact details of the relevant agencies, the type of vehicles, equipment and evacuation instruction or procedures to follow as well as suggestions of refuge areas.)

This would fit under the Humanitarian ICT category as well as to an extent data analytics
